The bmpsize package

Heiko Oberdiek* <heiko.oberdiek at googlemail.com>

2016/05/16 v1.7

Abstract

Package bmpsize analyzes bitmap images to extract size and resolution data. It adds this feature to the graphics package that now do not need separate bounding box files for bitmap images. Additionally the implementation for the inclusion of bitmap images in some drivers of package graphicx are rewritten to support options viewport, trim and clip.

1 Documentation

1.1 Introduction

The support of bitmap images in the TeX world is quite poor. TeX can read text files and thus parse the bounding box of EPS files, but it cannot read binary files. If TeX reads a line, it removes spaces before the line end and normalizes the line end itself to get independent from the convention of the operating system.

The situation changed with pdfTeX. It is a TeX compiler, where the output driver is already integrated. Images of type JPEG and PNG are supported directly and the size of the images are reported back to the TeX language. Thus it is easy for package graphics to get the size of the images.

The problem remains for other drivers than pdfTEX in PDF mode. The size information must either be given manually by the bounding box options or an additional file is used for each image, where the size information is stored as EPS bounding box. Program dvips comes with the program ebb that create these .bb files. However it ignores the natural size of the image and uses a fixed resolution of 100 DPI.

Since pdfTEX 1.30.0 there are some new primites. Especially \pdffiledump is very helpful. It reads a file in binary mode and reports the selected area as hex dump. It works in both DVI and PDF mode of pdfTEX. Thus it is now possible to read and parse bitmap files to get their size. This project uses this feature to implement parsers for many bitmap file types.

1.2 Bitmap image parsers

This project supports the following image types:

```
BMP, GIF, JPEG, MSP, PAM, PCX, PNG, PNM, SGI, TGA, TIFF, WMF, XPM
```

Consult the documentation of your TEX distribution and driver which types are supported by your driver. Sometimes automatically triggered conversions can be configured to extend the range of supported image types.

1.2.1 User interface

Package bmpsize hooks into package graphics. If an image is included and its size is not given, then bmpsize investigates the image. If it could be parsed as known bitmap file type, the size is reported back to package graphics.

The following options are added to the options of package graphicx:

resolutionunit: Specifies the unit of the options for setting the resolution. Default is 1in that means the numbers are interpreted as dots per inch (DPI).

defaultresolution: Bitmap files do not always provide information about their resolution (density). If this information is not given, the values of this option are used to calculate the image size. Default: 72!

resolution: This option override the resolution given in the bitmap file.

bmpsizefast: Values are true and false. The option is enabled by default. Then mainly ε -TEX's arithmetic is used to calculate the width and height. However the dimen dimensions are limited. Therefore overflow errors can happen. Disable then this option to use the arithmetic of package fp. It allows a larger range of numbers at the cost of speed.

Options defaultresolution and resolution expect two numbers, separated by a space. The first is taken as density for the horizontal x axis, the second for the vertical y axis. One of the numbers may be replaced by an exclamation mark. In this an aspect ratio is respected and the correct density for this axis automatically calculated. If one number is given, this number is used for both axes. Examples:

```
defaultresolution=72 !  % Default
resolution=100  % Simulates behaviour of program ebb
```

The options can be set in \includegraphics or using \bmpsizesetup. \setkeys{Gin} is equivalent to the latter case.

```
\bmpsizesetup{resolutionunit=1in, resolution=100}
\includegraphics[
  defaultresolution=72 !,
  bmpsizefast=false
]{image}
```

1.2.2 Hints

• My version of dvips.def 1999/02/16 v3.0i defines rules for the supported bitmap extensions, but does not include them in the list of extensions that are tried if the file name is not given with an extension. In such a case, the list of extensions can be set by \DeclareGraphicsExtensions, see grfguide. The following code just extends the list:

```
\makeatletter
\g@addto@macro\Gin@extensions{,.bmp,.pcx,.msp}
\makeatother
```

• My version of dvipdfm.def 1998/11/24 vx.x misses the graphics rule for PNG files. It can be added by:

```
\DeclareGraphicsRule{.png}{bmp}{.bb}{#1}
```

See the previous issue to add the extension .png to the list of extensions for package graphics.

1.2.3 Test program

There is a test program bmpsize-test.tex. Run it through latex, pdflatex, or pdftex. Then given image files are inspected and the result is printed.

1.2.4 Interface for programmers

The macro names of the parsers are $\bmpsize@read@\langle type\rangle$. Example: $\bmpsize@read@jpg$ in case of JPEG.

A parser sets the switch \ifbmpsize@ok to true, if it could successfully parse the image file. The width and height are returned in \bmpsize@width and \bmpsize@height. If information about density is available, it is used to calculate width and height of the image, otherwise the values given by option defaultresolution is used. resolution overwrites the values in the image file.

1.3 Improved bitmap inclusion

Some drivers for package graphics define the graphics type bmp for bitmap images. The code in the standard drivers for dvips, dvipdfm, and dvipdfmx is very basic and misses essential features of the package graphicx. Therefore the code for bitmap inclusion is automatically rewritten by this package to add the following features:

- Support for viewport and trim.
- Support for clip.
- In case of dvipdfm and dvipdfmx the bitmap images are reused and not included again if they are used more than once.

However, there is a difference between dvipdfm and dvipdfmx, especially if images are reused. In the former case the reused box has width and height of 1bp, in the latter case its natural width. Thus the correct driver option must be given. dvipdfm and dvipdfmx are not equivalent.

Older versions of dvipdfmx uses a size of 1in. However I do want to distinguish between versions of the same program. Therefore the support of these older versions has stopped with version 1.6 of this package. Use version dvipdfmx-20090708 or newer (some few versions before will probably also work, but I don't want to investigate this further).

2 Implementation

2.1 Basic package bmpsize-base

Identification.

- $1 \langle *base \rangle$
- ${\small 2\ \backslash ProvidesPackage\{bmpsize-base\}\%}$
- 3 [2016/05/16 v1.7 Basic part of bmpsize (HO)]%

Modules of package fp are used for calculations.

- 4 \RequirePackage{fp-basic}
- 5 \RequirePackage{fp-snap}

Package fp uses nested \loop structures. That breaks with the plain-TeX version of \loop. Therefore we use the LATeX variant.

\@bmpsize@plain@loop

Support for viewport/trim. The original bounding box is '0 0 width height'. If package bmpsize is used and the image has been recognized, then the original width and height are known (\bmpsize@width, \bmpsize@height). Otherwise we try the saved values \Gin@ourx and \Gin@oury. This guessing will fail, if options viewport and trim are used both or several times. This is a deficiency of package graphicx. One of options viewport and trim should be used at most once.

```

The size of reused images of dvipdfm 0.13.2c is 1bp. It is the default size of an image object in user space. Thus the reused image must be scaled to the requested width and height. The factor is just the conversion from pt to bp (72/72.27).

\bmpsize@dvipdfm@factor

2028 (dvipdfm) \def\bmpsize@dvipdfm@factor{.99626}

Unhappily dvipdfmx behaves differently. It remembers the size assuming a resolution of 100 dots per inch and additionally scales the reused image to this size. Thus the scaling factor also depends on the pixel sizes of the image:

```
• width: (72 / 72.27) * (100 / 72) / \text{pixelwidth} = 100 / 72.27 / \text{pixelwidth}
```

• height: 100 / 72.27 / pixelheight

Recent versions however use the natural size of the reused image. Thus the factor is the difference between the requested size and the natural size.

\Ginclude@bmp

Added features: support for viewport/trim, clip, and image reuse.

```
2029 \def\Ginclude@bmp#1{% 2030 \message{<#1>}%
```

\dimen@\z@

2042

Clip support is achieved by putting the image inside a xform object. These xform objects are automatically clipped when they are used.

3 Installation

3.1 Download

Package. This package is available on CTAN¹:

CTAN:macros/latex/contrib/oberdiek/bmpsize.dtx The source file.

CTAN:macros/latex/contrib/oberdiek/bmpsize.pdf Documentation.

Bundle. All the packages of the bundle 'oberdiek' are also available in a TDS compliant ZIP archive. There the packages are already unpacked and the documentation files are generated. The files and directories obey the TDS standard.

CTAN:install/macros/latex/contrib/oberdiek.tds.zip

TDS refers to the standard "A Directory Structure for TEX Files" (CTAN:tds/tds.pdf). Directories with texmf in their name are usually organized this way.

 $^{^{1} \}verb|http://ctan.org/pkg/bmpsize|$

3.2 Bundle installation

Unpacking. Unpack the oberdiek.tds.zip in the TDS tree (also known as texmf tree) of your choice. Example (linux):

```
unzip oberdiek.tds.zip -d ~/texmf
```

Script installation. Check the directory TDS:scripts/oberdiek/ for scripts that need further installation steps. Package attachfile2 comes with the Perl script pdfatfi.pl that should be installed in such a way that it can be called as pdfatfi. Example (linux):

```
chmod +x scripts/oberdiek/pdfatfi.pl
cp scripts/oberdiek/pdfatfi.pl /usr/local/bin/
```

3.3 Package installation

Unpacking. The .dtx file is a self-extracting docstrip archive. The files are extracted by running the .dtx through plain TFX:

```
tex bmpsize.dtx
```

TDS. Now the different files must be moved into the different directories in your installation TDS tree (also known as texmf tree):

```
\begin{array}{lll} bmp size.sty & \rightarrow tex/latex/oberdiek/bmp size.sty \\ bmp size-base.sty & \rightarrow tex/latex/oberdiek/bmp size-base.sty \\ bmp size-test.tex & \rightarrow tex/latex/oberdiek/bmp size-test.tex \\ bmp size-dvips.def & \rightarrow tex/latex/oberdiek/bmp size-dvips.def \\ bmp size-dvipd fm.def & \rightarrow tex/latex/oberdiek/bmp size-dvipd fm.def \\ bmp size-dvipd fmx.def & \rightarrow tex/latex/oberdiek/bmp size-dvipd fmx.def \\ bmp size.pdf & \rightarrow doc/latex/oberdiek/bmp size.pdf \\ bmp size.dtx & \rightarrow source/latex/oberdiek/bmp size.dtx \\ \end{array}
```

If you have a docstrip.cfg that configures and enables docstrip's TDS installing feature, then some files can already be in the right place, see the documentation of docstrip.

3.4 Refresh file name databases

If your TEX distribution (teTEX, mikTEX, ...) relies on file name databases, you must refresh these. For example, teTEX users run texhash or mktexlsr.

3.5 Some details for the interested

Unpacking with IATEX. The .dtx chooses its action depending on the format:

plain T_EX: Run docstrip and extract the files.

LATEX: Generate the documentation.

If you insist on using \LaTeX for docstrip (really, docstrip does not need \LaTeX), then inform the autodetect routine about your intention:

```
latex \let\install=y\input{bmpsize.dtx}
```

Do not forget to quote the argument according to the demands of your shell.

Generating the documentation. You can use both the .dtx or the .drv to generate the documentation. The process can be configured by the configuration file ltxdoc.cfg. For instance, put this line into this file, if you want to have A4 as paper format:

\PassOptionsToClass{a4paper}{article}

An example follows how to generate the documentation with pdfIATEX:

```
pdflatex bmpsize.dtx
makeindex -s gind.ist bmpsize.idx
pdflatex bmpsize.dtx
makeindex -s gind.ist bmpsize.idx
pdflatex bmpsize.dtx
```

4 Catalogue

The following XML file can be used as source for the TEX Catalogue. The elements caption and description are imported from the original XML file from the Catalogue. The name of the XML file in the Catalogue is bmpsize.xml.

```
2262 (*catalogue)

2271
2272
      <description>
       This package analyzes bitmap images to extract size and resolution
2273
       data. It adds this feature to the graphics package so it is no
2274
       longer necessary to provide a separate bounding box files for
2275
       bitmap images. dditionally the implementation for the inclusion
2276
       of bitmap images in some drivers of package
2277
2278
       <xref refid='graphicx'>graphicx</xref> are rewritten to support
2279
       options viewport, trim and clip. The package requires
       <xref refid='pdftex'>pdfTeX</xref> version 1.30.0 or later (the
2280
2281
       relevant pdfTeX primitive operates in both DVI and PDF output
2282
       modes).
2283
       The package is part of the <xref refid='oberdiek'>oberdiek</xref>
2284
2285
       bundle.
2286 </description>

6 History

[2006/08/24 v1.0]

• First version.

[2007/02/18 v1.1]

• 1in replaced by 72.27pt, because TeX is inaccurate if 1in is given.

[2007/04/11 v1.2]

• Line ends sanitized.

[2007/05/01 v1.3]

- Uses package infwarerr.
- Image reuse algorithm fixed for dvipdfmx.
- Some support for Exif's orientation tag.

[2007/11/11 v1.4]

- Use of package pdftexcmds for LuaTeX support.
- Fix of bug of package keyval: \KV@err and \KV@errx are used, but undefined if loaded by plain TEX.

[2008/08/11 v1.5]

- Code is not changed.
- Update of URLs.

[2009/09/04 v1.6]

• Fixes for reusing objects with dvipdfmx-20090708. Older versions of dvipdfmx are no longer supported.

[2016/05/16 v1.7]

• Documentation updates.
